Promoting survival of retinal cells, or delaying or preventing retinal cell injury or death, by contacting retinal cells with PRO175, 220, 216, 243, 306, 346, 322, 536, 943, 840, 828, 826, 1068 or PRO1132 polypeptide -

# Claim 44; Fig 6; 152pp; English.

The invention relates to promoting the survival of retinal cells, or delaying or preventing retinal cell injury or death, by contacting the retinal cells with the polypeptide such as PRO17, PRO220, PRO316, PRO343, PRO343, PRO340, PRO320, PRO316, PRO343, PRO340, PRO3400, PRO3400 ischaemic condition, central or branch retinal vision occlusion, collagen vascular disease, thrombocytopaenic purpura, uveitis, retinal vasculitis, occlusion associated with Eales disease or systemic lupus erythematosus), retinal injury or environmental trauma. The retinal cell injury or death is delayed or prevented by substantially not causing angiogenesis or mitogenesis. The present sequence represents a PRO protein.

8

The present invention relates to bone marrow expressed polynucleotides and proteins. These sequences can be used in the treatment of inflaumatory conditions (eg arthritis, Crohn's disease), cancer, central and peripheral nervous system diseases and neuropathies, such as Alzheimer's, Parkinson's and Huntington's diseases, spinal cord disorders, head trauma, cerebrovascular diseases, myeloid and lymphoid cell disorders, platelet disorders, stem cell disorders, bone degenerative disorders, autoimmune disorders, for example multiple

the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide to factor VITA. The PRO polypeptides can be used in assays to identify molecules involved in binding interactions. The polynucleotides encoding PRO polypeptides can be used to generate probes, antisense RNA/DNA, transgenic or knock out animals and can be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PRO polypeptides, and to detect the presence of mammalian lung, colon, breast, prostate, rectal, cervical or liver tumours by comparing PRO polypeptide expression in a cell sample to that in a control sample. Some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, the proliferation or differentiation of chodrocytes, the proliferation or gene expression in pericyte cells, the release of proteoglycans from cartilage, the proliferation of inner ear utricular supporting cells or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PRO polypeptides. The PRO polypeptides are useful to detect other PRO polypeptides, to link bioactive molecules to cells expressing PRO polypeptides, to modulate biological activities of cells expressing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of T-lymphocytes, the release of a cytokine from peripheral blood monocytes (PBMCs), or the proliferation of endothelial cells. Some of

Sequence 2, Application US/09182024A

Sequence 2, Application US/09182024A

Patent No. 6342370

GENERAL INFORMATION:
APPLICANT: Connolly, Timothy
APPLICANT: Rajbut, Bhanu
TITLE OF INVENTION: Human Slit Polypeptide and Polynucleotides Encoding
TITLE OF INVENTION: Same
FILE REFERENCE: 640100-271

CURRENT APPLICATION NUMBER: US/09/182,024A

PRIOR FILING DATE: 1997-10-31

PRIOR APPLICATION NUMBER: 60/063,946

PRIOR PILING DATE: 1998-13

PRIOR FILING DATE: 1998-08-13

NUMBER OF SEQ ID NOS: 5
